

## Most commonly asked questions regarding BIOPRO

### 1. What is in the Chip and how does it work?

The BIOPRO chips are made of a flexible resin and are programmed to harmonize or neutralize the harmful EMF waves that enter the body. The proprietary programming process activates the chip to coincide with the specific frequency range of each particular device, i.e. cell phone, motor vehicle or home phone. The activated chip creates an energy field and has the ability to take a harmful EMF wave and change it into a harmless wave.

A simple analogy would be that of a CD ROM. An empty or blank CD in a computer that has no information provides no value. However, once the CD is programmed with vital information, it performs and functions in a powerful way. The BIOPRO Chip is programmed in a similar way. This is a process proprietary to BIOPRO.

### 2. If I can't feel anything, how do I know the Chip is working?

Approximately 40 – 50% of the population has a sensitivity to EMF radiation. When they use a Cell Phone, they can feel a burning sensation in their ear, headaches, tension, soreness behind the ear or feel less energy after long periods of time on the Cell Phone. Sometimes a lack of energy can be felt after extended periods of time on a cordless home phone or after a long ride in a motor vehicle. What occurs is a depletion of energy due to EMFs entering the human body.

The BIOPRO Chips help the body avoid a stress response which keeps the body at a normal energy level. Also, when we avoid stress response, we are proactive in helping our bodies fight a number of diseases. Most of us are aware that many diseases are stress related and in some cases, diseases are caused by stress.

EMFs cannot be seen, touched or felt. For that reason many people cannot feel the technology working since it affects us at the cellular level.

The truth is that whether or not you feel the technology working, the EMF waves are in fact being converted from harmful to harmless waves.

### 3. I'm not convinced about the real threat of EMFs. If it's so harmful why aren't more people dying from this problem?

The negative effects of EMFs are cumulative. As a population we have become slowly conditioned over time to adapt to external stressors including EMF. Specific correlations have been proven, however, as there have been many instances of brain tumors the size and shape of cell phone antennas and tumors on the side of the brain where people hold their cell phone. In other words, if you are diagnosed with a tumor or cancer in the brain there is a much higher chance (75%) that it will be on the side where you hold your cell phone. Study after study has validated that there is a significant risk and correlation between EMF radiation and damage to the body.
